

# On the Origin of Species: A Scientific Revolution and Literary Masterpiece

Charles Darwin's *On the Origin of Species*, published in 1859, is widely recognized as the single most influential work in the history of science. Its revolutionary theory of evolution by natural selection forever altered our understanding of the natural world, and its impact continues to reverberate through science, philosophy, and culture today.

## The Scientific Revolution

Before Darwin, most scientists believed that the species on Earth were fixed and unchanging, created by God in their current forms. Darwin's theory of natural selection, however, challenged this view. He argued that species evolve over time through a process of gradual change, driven by the differential survival and reproduction of individuals with favorable traits.
